Familial Hypercholesterolemia (FH)  
A common genetic disorder that causes early heart disease

WHY CHANGE IS NECESSARY

FH leads to early heart disease, the #1 killer in the world.¹

90% of people with FH have not been properly diagnosed.¹

Untreated, individuals with FH are at a 20 times higher risk of having an early heart attack.³

Untreated women have a 30% risk of having a heart attack by age 60.⁴

If left untreated, men have a 50% risk of having a heart attack by age 50.⁴

The Good News is...

Early Diagnosis and Treatment Saves Lives

WHAT YOU CAN DO

Find an FH Specialist
Visit our website to find a doctor who specializes in FH near you.

Join the FH Community
If you or a family member is living with FH, we are here for you. Join us and get access to the information you need to get the care you need.

Raise awareness of FH
Start the conversation. In order to receive accurate diagnosis and better care, share this message with your friends and family.
